Experiment -2 .1

AIM: To enable Multi-Factor Authentication (MFA) for the AWS root user to enhance account security.

Description:

Multi-Factor Authentication (MFA) is a security feature that provides an additional layer of protection to an AWS account. It requires users to provide two forms of authentication: a password and a verification code generated by an authenticator application.

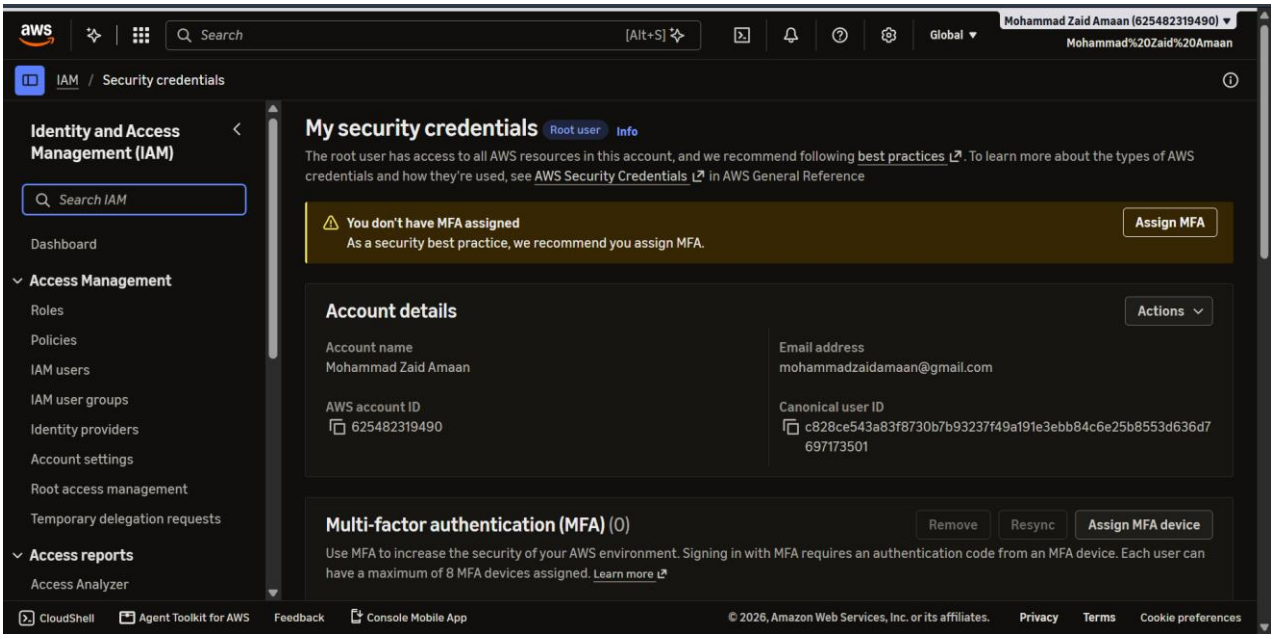

AWS supports authenticator applications such as Google Authenticator, Microsoft Authenticator, Authy and Duo Mobile.

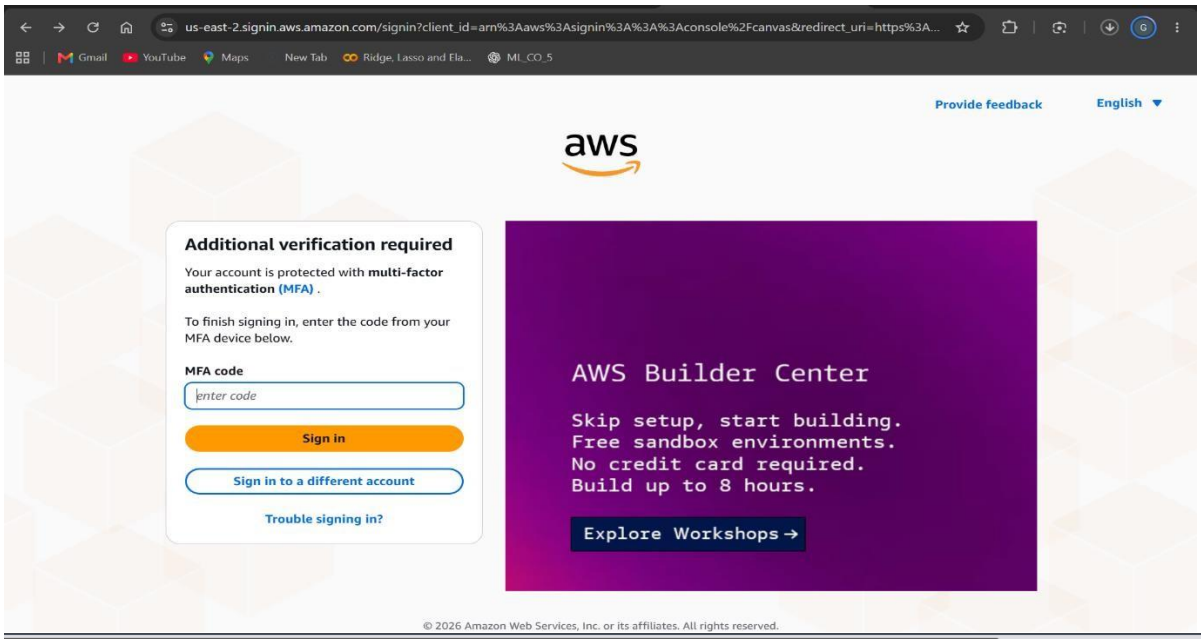

Steps:

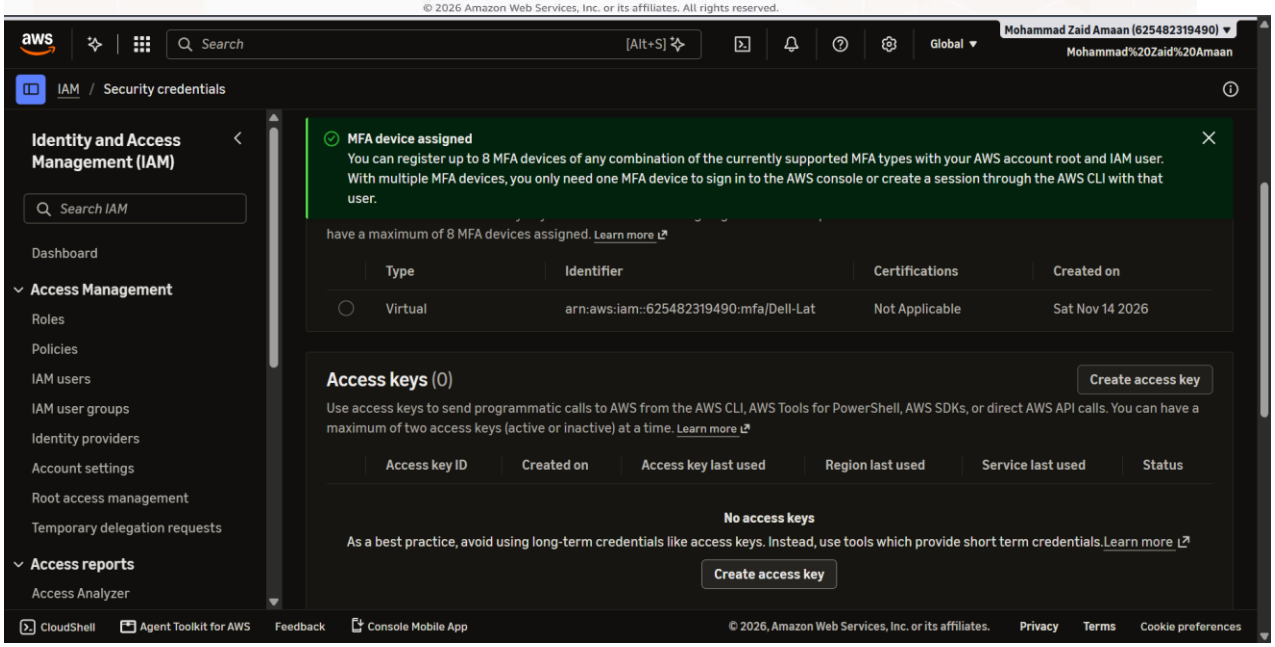

1. Sign in to the AWS Management Console using the root user email and password.
2. Click the account name in the top-right corner.
3. Select **Security Credentials**.
4. Navigate to the Multi-Factor Authentication (MFA) section.
5. Click **Assign MFA Device**.
6. Enter a device name, such as root-phone.
7. Select **Authenticator App** and click Next.
8. Click **Show QR Code**.
9. Open Google Authenticator or another authenticator application on your mobile.
10. Select Add Account and scan the QR code displayed on the AWS console.
11. Enter the first six-digit verification code in MFA Code 1.
12. Wait for the code to refresh and enter the next verification code in MFA Code 2.
13. Click **Add MFA** to complete the configuration.
14. Verify that the MFA device appears under the root user's security credentials.

Output:

Multi-Factor Authentication (MFA) was successfully enabled for the AWS root user using an authenticator application. The AWS account now requires both a password and an authentication code during sign-in.

MFA device assigned
You can register up to 8 MFA devices of any combination of the currently supported MFA types with your AWS account root and IAM user. With multiple MFA devices, you only need one MFA device to sign in to the AWS console or create a session through the AWS CLI with that user.
have a maximum of 8 MFA devices assigned. Learn more

Access keys (0)
Create access key
Use access keys to send programmatic calls to AWS from the AWS CLI, AWS Tools for PowerShell, AWS SDKs, or direct AWS API calls. You can have a maximum of two access keys (active or inactive) at a time. Learn more
