AIM: To configure Multi-Factor Authentication (MFA) for an AWS IAM user to provide additional security to the AWS account**.**

Description:

Multi-Factor Authentication (MFA) is an additional security mechanism provided by AWS. It requires an IAM user to verify their identity using a password and a six-digit authentication code generated by an authenticator application.

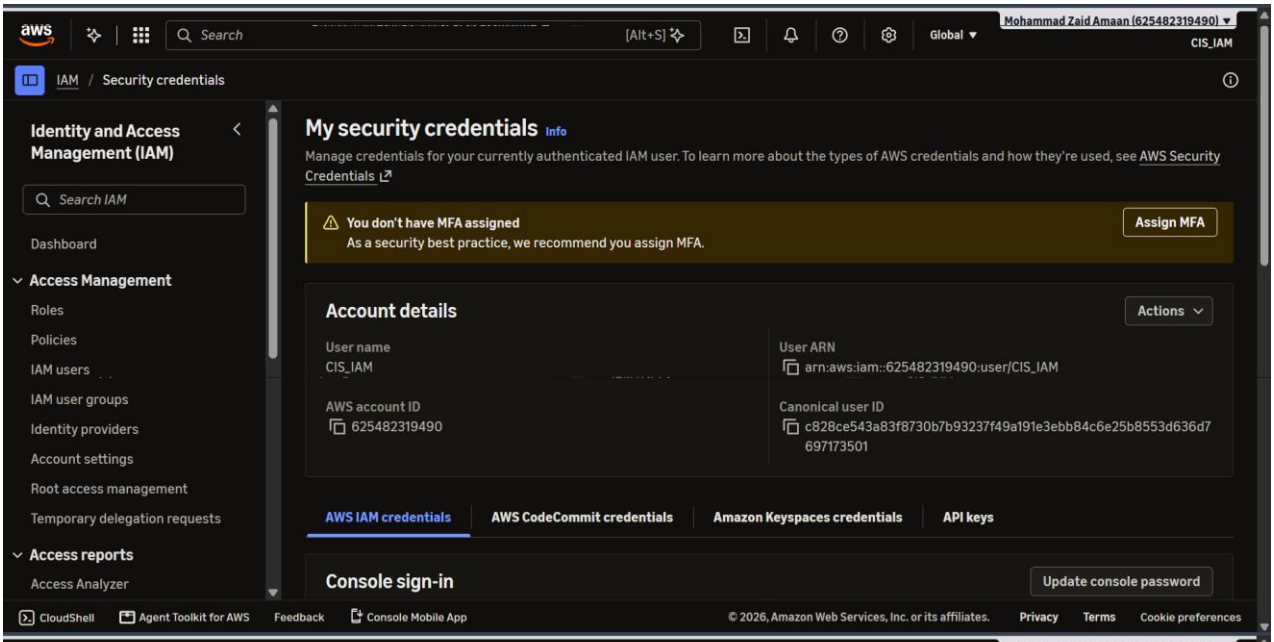

MFA helps protect AWS resources from unauthorized access. Applications such as Google Authenticator, Microsoft Authenticator and Authy can be used to generate verification codes.

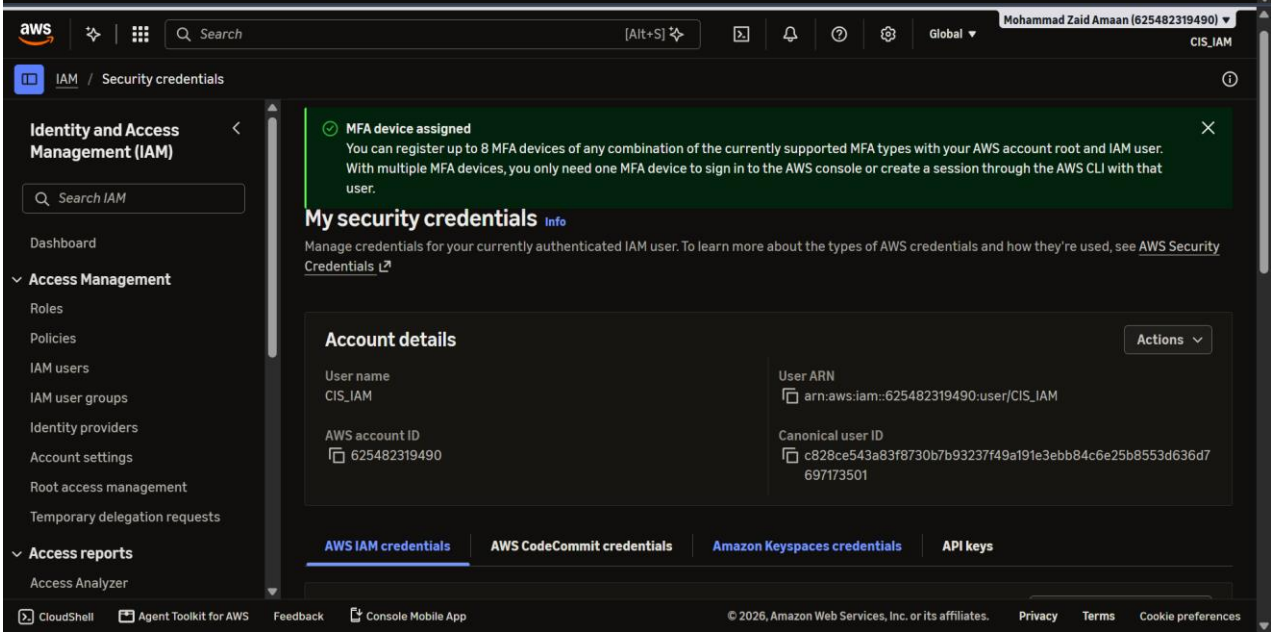

Steps:

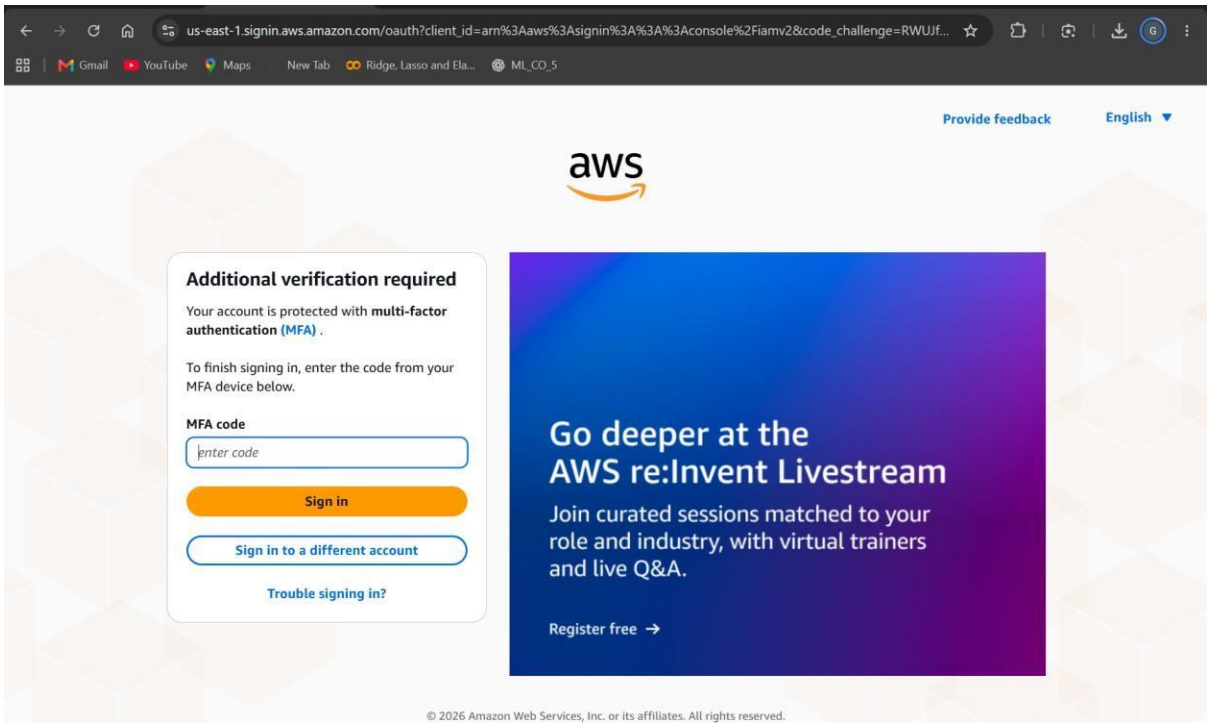

1. Sign in to the AWS Management Console using the root user credentials.
2. Search for and open the **IAM (Identity and Access Management)** service.
3. Select **Users** from the left navigation panel.
4. Select the IAM user for which MFA needs to be configured.
5. Open the **Security Credentials** tab.
6. Navigate to the Multi-Factor Authentication (MFA) section.
7. Click **Assign MFA Device**.
8. Enter a device name, such as iam-user-phone.
9. Select **Authenticator App** and click Next.
10. Click **Show QR Code**.
11. Open Google Authenticator on your mobile phone.
12. Select Add Account and scan the QR code displayed on the AWS console.
13. Enter the first six-digit verification code in MFA Code 1.
14. Wait for the code to change and enter the second verification code in MFA Code 2.
15. Click **Add MFA** to complete the configuration.
16. Verify that the authenticator device appears under the IAM user's MFA settings.

Output:

Multi-Factor Authentication (MFA) was successfully configured for the AWS IAM user using Google Authenticator. The IAM user now has an additional layer of security, requiring an authentication code along with the password during sign-in.
